

**DATA 3464: Fundamentals of Data Processing**

---

# **Numeric Data Transformations**

Charlotte Curtis

January 27, 2026

# Topic overview

---

- Why transformations are necessary
- Common transformations
- Dimensionality reduction

## Resources used:

- [Feature Engineering Chapter 6](#)
- Hands on Machine Learning with Scikit-Learn and Tensorflow/PyTorch, Chapter 4.  
Available at [MRU Library](#)
- [Scikit-learn user guide: Chapter 7](#)
- Introduction to Machine Learning with Python. Available at [MRU Library](#)

# Common 1:1 transformations

---

*"Most models work best when each feature (and in regression also the target) is loosely Gaussian distributed" -- Introduction to Machine Learning with Python*

- Scaling: normalization or standardization
- Nonlinear transforms: log, square root, polynomial
- Fancier methods: Box-Cox, Yeo-Johnson

# A brief intro to gradient descent

---

- Many linear models minimize some cost function through **gradient descent**
- The **gradient** is a vector of partial derivatives

$$\nabla f = \begin{bmatrix} \frac{\partial f}{\partial x_1} \\ \frac{\partial f}{\partial x_2} \\ \vdots \\ \frac{\partial f}{\partial x_n} \end{bmatrix}$$

for some scalar-valued  $f(\mathbf{x})$

# Descending the gradient

---

For a loss (or cost) function such as  $MSE(\theta) = \frac{1}{m} (\mathbf{X}\theta - \mathbf{y})^T (\mathbf{X}\theta - \mathbf{y})$

1. Start with a random  $\theta$
2. Calculate the gradient  $\nabla_{\theta}$  for the current  $\theta$
3. Update  $\theta$  as  $\theta = \theta - \eta \nabla_{\theta}$
4. Repeat 2-3 until some stopping criterion is met

where  $\eta$  is the **learning rate**, or the size of step to take in the direction opposite the gradient.

# Visualizing in 2D

- The gradient has  $m + 1$  dimensions, where  $m$  is the number of features
- step size  $\eta$  is a scalar parameter

*Main takeaway: feature should be more or less on the same scale*

# Approaches to scaling

---

Standardize:  $x_{scaled} = \frac{x - \mu_x}{\sigma_x}$

Normalize:

$$x_{scaled} = \frac{x - \min(x)}{\max(x) - \min(x)}$$

# Nonlinear transforms

---

- Common case: count data
- Example: Ask 1000 students how often they checked D2L that day
- Not a Gaussian distribution!
- What about the central limit theorem?

**Where we left off on January 27**

---

# Transformations in training vs inference

---

- Define functions, e.g.

```
def standardize(X, mu, sigma):  
    return (X - mu) / sigma
```

- Compute scaling parameters **on the training data**, then stash them somewhere:

```
mu = X_train.mean()  
sigma = X_train.std()  
# ... later on, during inference  
X = standardize(X, mu, sigma)
```

*What would happen if `standardize` instead computed values on the fly?*

*What else am I missing here?*

# Manual approach in the wild

---

You may run across [magic numbers](#), e.g from the [PyTorch tutorials](#):

```
import torch
from torchvision import transforms, datasets

data_transform = transforms.Compose([
    transforms.RandomResizedCrop(224),
    transforms.RandomHorizontalFlip(),
    transforms.ToTensor(),
    transforms.Normalize(mean=[0.485, 0.456, 0.406],
                          std=[0.229, 0.224, 0.225])
])
```

This really should have a comment! Derived from [ImageNet](#).

# An alternative solution: Scikit-learn

## Pipeline s

---

- Hard-coding scaling (and other) parameters is okay, provided you can **justify the choice** and **document where they came from**
- Scikit-learn has a handy [Pipeline](#) class that handles this for you
- Each step in the pipeline has a `fit` and `transform` method
  - `fit` computes parameters from the training data
  - `transform` applies the transformation
  - `fit_transform` does both -- **only use on training data!**
- You can call these functions on the whole pipeline to fit or apply all in one go

# Different processing for different features

- Linear pipelines are great for doing the same thing to multiple features
- Most of the time, different features need different processing
- We can use a [ColumnTransformer](#) to split the pipeline
